

Worldwide Climate Change

- 1) When it comes to the worldwide climate change
Much more intense drought, storms and heat waves are quite a high range
Rising sea levels, melting glaciers and warming oceans also bringing to animals harm
Including on many a different farm
- 2) To rid of this climate change frown
On coal, oil and gas we need to cut down
Or if entirely all countries do not
It'll soon be everywhere getting much too hot
- 3) Climate change affects the social and environmental determinants of health
Which are much more important than wealth
If we don't worldwide quickly take action
The number of people and animals suffering will increase by a very big fraction
- 4) So, to bring the temperature down
We need to all stop using coal, oil and gas like a clown
But everywhere start having a careful thought
And be using things like electricity more as we ought
